

Electrical

What we can offer your business

Our highly skilled electrical team specialises in engineering, design and manufacture of electrical control systems for just about any application, ranging from the basic right through to the highest level systems that incorporate specialised instrumentation, automation, data logging and remote control.

Having a wide range of skills and experience with all manner of electrical control systems, the electrical workshop team also offers a consultancy service to customers who require assistance in selecting the best system(s) to suit their requirements.

If you can think of it, the electrical team can design it and make it happen for you!

Key services include

- Engineering, design, manufacture and commissioning of new electrical and instrumentation control systems complete with Auto CAD drawings and operational documentation.
- Upgrades of existing electrical and instrumentation installations.
- High level PLC and HMI programming with expertise in complex electrical systems including automated processes and PID applications.
- Development and installation of SCADA systems, including remote control and data acquisition systems via SMS technology.
- Instrumentation installation and calibration services.
- Fault finding complex electrical control systems and circuits.
- Vast experience within the water industry including water supply and filtration systems, pressure boosting systems and chemical dosing systems.
- Ability to take on all manner of electrical control systems, not just those limited to the water industry.
- Consultancy services available to customers seeking assistance in selecting the best system for their application.
- Expertise in the latest technology and skilled staff who can deliver outstanding results for every customer.
